

Rail indicatrices (linear constraint n normalization = ellipse): the unifying formalism

FLRW ($\hat{E} = 3$): circles,
no wind; freezing $a \rightarrow \hat{E}$

Vaidya (EF, $E = 1.2$): ingoing radial
wind $f - E^2 < 0$; $m(v)$ moves everything

Thakurta-Kerr ($r = 2.2$, $s = 0.9$): angular
wind (dragging); $A(\eta)$ shrinks it
