

Kerr ($A = 1, s = 0.9, E = 1.2$, arrival $r = 8.0, |J| = 1.3$):
 τ BOUNCES (mirror pair, no wind); η SPIRALS onto the horizon

the two scalars breathing on the rigid geometry α_K :

$$n = \hat{E}/\sqrt{\hat{E}^2 - A^2 f} \text{ } (\eta, t \text{ branches}), \quad k_\tau = A^2 f/(\hat{E} \hat{v}) \text{ } (\tau \text{ branch})$$
